

Measuring SEO: Search Console & GA4

Tracking visibility, traffic and results — and keeping up with change

Google Search Console

- Domain property via DNS is the most complete.
- Clicks, impressions, CTR, position.
- 16 months of history.

Google Analytics 4

- Mark business actions as key events.
- Filter traffic by Organic Search.
- Link GA4 and Search Console.

Algorithm updates and staying current

- Check the Search Status Dashboard.
- Wait for rollouts to finish before reacting.
- Trust primary sources over rumours.

Indexing and URL Inspection

- Check excluded reasons regularly.
- Inspect a URL after important changes.
- Submit and monitor your sitemap.

Reporting that connects to business outcomes

- Visibility → traffic → outcomes.
- Compare like with like.
- Every report ends with next actions.

Search Console Performance metrics

Metric	Meaning	Use it to
Impressions	Times a URL appeared in results	Measure visibility
Clicks	Times users clicked through	Measure traffic from Google
CTR	Clicks ÷ impressions	Find titles/snippets to improve
Average position	Mean ranking position	Track topic-level progress

Monthly SEO report template

Section	Metrics
Visibility	Impressions, priority keyword positions
Traffic	Organic clicks, organic sessions (GA4)
Outcomes	Key events from organic traffic
Health	Indexing errors, Core Web Vitals status
Next actions	Top three priorities for next month

Remember

- Search Console tells you how Google sees you; GA4 tells you what visitors do.
- Report visibility, traffic and outcomes — in that order.
- Follow official sources and don't react mid-update.
